

# ABSTRACT

[0026] A method of testing the hearing of a user utilizing a computer system. The computer system includes a computer and a speaker. The computer can output an electrical signal to the speaker. The speaker can convert the electrical signal into a stimulus. The method includes: downloading a computer program from a server to the computer; executing the computer program on the computer, the execution of the computer program generating an audio stream; based upon the audio stream, generating a stimulus; and receiving an input from the user that indicates that the user heard the stimulus.
